

# **INVAR 36**

#### Identification

UNS Number K93601/K93603

#### **Type Analyses**

| Carbon  | 0.02 %  | Manganese | 0.35 %  |
|---------|---------|-----------|---------|
| Silicon | 0.20 %  | Nickel    | 36.00 % |
| Iron    | Balance |           |         |

#### **General Information**

• Description:

Invar 36 is a nickel-iron alloy possessing a rate of thermal expansion approximately onetenth that of carbon steel at temperatures up to 400°F (204°C).

• Applications

Invar 36 has been used for applications where dimensional changes due to temperature variation must be minimized such as in radio and electronic devices, aircraft controls, optical and laser systems, etc.

Invar 36 has also been used in conjunction with high expansion alloys in applications where a motion is desired when the temperature changes, such as in bimetallic thermostats and in rod and tube assemblies for temperature regulators.

#### **Corrosion Resistance**

Important note: The following 4-level rating scale is intended for comparative purposes only. Corrosion testing is recommended; factors which affect corrosion resistance include temperature, concentration, pH, impurities, aeration, velocity, crevice, deposits, metallurgical condition, stress, surface finish and dissimilar metal contact.

Humidity Good

### **Properties**

#### **Heat Treatment**

Heat Treatment for Optimal Dimensional Stability.

The presence of cold work stresses very slight changes in dimensional stability with respect to time and temperature. This change can be detected only with exceedingly sensitive devices.

To assure optimal dimensional stability, heat to 1500°F (315°C) holding one hour at heat, then air cool.

To promote temporal stability (when necessary), Invar 36 has been aged for 24 to 48 hours at 200°F (92°C).

#### Annealing:

Heat to 1450°F (790°C) and hold at heat 30 minutes per inch of thickness, then air cool. Heating to temperatures above 1000°F (538°C) relieves the presence of cold work stresses. The higher the temperature, the lower the annealed hardness, as shown in the following table.

Specimen held 5 minutes at heat:

|      | Temperature<br>Air Treat |            |  |
|------|--------------------------|------------|--|
| °F   | °C                       | Rockwell B |  |
| 1200 | 650                      | 87/88      |  |
| 1500 | 815                      | 77/78      |  |
| 1800 | 980                      | 70/71      |  |
| 1900 | 1040                     | 66/68      |  |

# Workability

• Forging:

The principal precaution to observe in forging is to heat quickly and avoid soaking in the furnace. Long soaking may result in a checked surface due to absorption of sulfar from the furnace atmosphere and/or oxide penetration. A forging temperature of 2000/2150°F (1100/1180°C) is preferred.

#### Blanking and Forming

Invar 36 presents no unusual problems in blanking and forming. For cleanest blanking properties, a Rockwell hardness of B 90 is suggested. This hardness will allow mild bending and forming operations. Where deep drawing operations are involved a finish annealed strip of a Rockwell hardness of abut B 75 is usually desirable.

• Grinding and Polishing:

A silicon carbide wheel is desirable, preferably a soft wheel which will wear without loading. For finish grinding, a satisfactory grade to start with is No.80 grit.

• Weld ability:

Invar 36 can be welded by the conventional methods. Caution must be taken so as not to overheat the molten metal. This will avoid spattering of the molten metal and pits in the welded area. When filler rod is required, invarrod has been used.

• Brazing

Silver and zinc-free alloys have been used for brazing Invar 36. This alloy should be annealed prior to brazing. Joints should be designed to avoid placing Invar 36 in tension during brazing.

### • Plating:

Invar 36 can be chromium, cadmium and nickel plated or zinc coated by the usual methods used for ferrous alloys.

### **Other Information**

Applicable Specifications Invar 36 meets the requirement of specifications ASTM B753 Alloy T36.
